Why Managed Hosting?

You have a business to run. Compulogics can help you maintain your focus on what you do best. Our resources can free you from the day to day management of your servers, applications and data. And it will be available to you anywhere, at anytime.

Whether you're looking to eliminate your IT room, or simply make your most used applications available anywhere, we can help. We can host your website, provide email services, or host even the most sophisticated database structures. Our fault-tolerant systems will be up and running, even when you're not.

Managed hosting is complex at it's core, but the benefit is simple to understand. Example: On a typical 20 workstation network, there are several applications that are shared. The sales force uses a Microsoft SQL based program to log sales, track client contacts, etc. Accounting uses a Quickbooks multi-user version for Accounts payable, receivables, and payroll. Everyone uses Microsoft Exchange for their email. Hosting these applications yourself requires at least (2) servers, more than likely (2) backup tape devices, and at least one battery backup system. You HAVE to maintain your server service-packs, make sure the email system is backed up regularly, and don't forget about the critical accounting data. If you lose power, your battery backup system will keep you running for a few minutes, just enough time to shut the servers down (sudden power loss to servers can corrupt data). You probably even have your network support company come out and check everything occasionally, if you're on top of things. On Saturday, you might even go into the office to catch up on some things you didn't quite get to. Wait, business has been really good the last couple of months, and your sales force is expanding, so is your accounting department. Your IT support says they can shedule you in a couple of weeks to upgrade your Email and SQL server. Might take hours to copy the data over, he warns...

The other side of this coin is freedom. With a Compulogics hosted solution, all you need to maintain are your workstations, your Internet connection and maybe a printer or two. Compulogics will do the rest. We will take care of the Server operating systems and service packs, the SQL databases, the Microsoft Exchange system. We'll back up your data every night. Our power never goes out (we have generators the size of small houses). Need a new server, or just more disk space for your expanding email? Give us 30 minutes, and we'll have it done. We have over 160 different Network connections, all going out to the Internet. We'll give your sales force the connection to the database, wherever they are. Accounting can stay home sick, but still do their work. You can connect from home, finish the emails you missed at work, then go play golf. You're covered.

Hosting Services

Our Resources

World Class DataCenters

Compulogics utilizes some of the most sophisticated datacenters available today. The facility pictured above is located in south Florida. This Terremark™ Cloud hosting center houses over 160 Tier 1 global network carriers. Miami has been ranked as one of the top-five best interconnected cities in the world, ahead of San Francisco, Chicago and Washington, D.C. Terremark's NAP of the Americas makes Miami the only city in the U.S. where Optical, Ethernet, MPLS, Voice and Internet traffic is handed off in a single location. The NAP of the Americas is located in downtown Miami, an area that has numerous telecommunications carrier facilities, fiber loops, international cable landings and multiple power grids. The convergence of telecommunications infrastructure is why global carriers, ISPs and other Internet-related businesses, educational institutions, and enterprises have chosen to become Terremark clients.

Switching the majority of South America, Central America and the Caribbean's layer-1, layer-2 and layer-3 traffic bound to more than 148 countries in the world, makes the NAP of the Americas the unrivaled gateway to the Americas.

This unique facility provides you with a secure, reliable carrier-neutral facility with direct backbone access to the world's major carriers. Via this massive connectivity, we can deliver to millions of businesses and consumers virtually anywhere in the world any available service from any network service provider in the world.

Access to your data, world-wide.

CompuLogics

Hosting Services

About Us

Compulogics Hosting, located in Central California, has a 10 year history of providing data hosting services. The origins of Compulogics as a network support and application consulting firm have paved the way for adopting newer methods of environment support. We were among the first to take advantage of "Virtual" systems, beginning with VMware, in 1999. Since the first *"virtual machine"* was introduced, virtual systems have matured dramatically - as has our ability to provide support.

Compulogics currently hosts its own internal secure datacenter for the public cloud. We provide dataservices, web content and email services to a long list of clients. In addition to our own internal resources, we maintain co-locations with multiple Tier 1 facilities, including Terremark® NAP of the Americas. Between our internal facilities and our co-locations, we provide cloud hosting to a diverse client list, ranging from the automotive sector (Dealership management systems), to sophisticated medical and dental systems. Compulogics maintains staff engineers and provides continuous technical training for the ever evolving technologies of Virtual and Cloud hosting. The "Team" philosphy that encompasses our staff, and our collective commitment to your satisfaction guarantees quality service.

Our staff of certified engineers can convert and manage even the most complex network structures, along with MS SQL, Oracle and Sybase database products.
The combination of our qualified staff, and the hardened datacenters we utilize, means your data is insulated from disaster.

At Compulogics, we are a team.

Services

If you decide that the WebConnect version of Henry Schein's DentalVision is the product for you, Compulogics can help you from beginning to end. What we do:

- **Environment Preparation**
Compulogics will work with your local IT support to ensure that each workstation has the proper hardware capabilities, operating system and browser version as required by DentalVision WebConnect. We will also help verify that your network and network equipment are properly configured for efficient operation. We can assist with local resource requirements, such as local storage for xrays, documents, printer sharing, etc. We can help your local support with mapping an efficient strategy for implementation.

- **Deploying to the Cloud**
The Compulogics team will work closely with Henry Scheins' technical services, coordinating database conversions or upgrades. Once the go ahead is received from Henry Schein, we will establish a test site for customer review. The next step is.....freedom.

- **How is your data stored?**
Your data will be hosted at one of the most secure datacenters in the world. The data systems that we manage are stored across many redundant systems, with backup generators, and redundant internet connections. It will ALWAYS be available.

- **Is my data backed up?**
Every database system is backed up nightly. In addition, Compulogics maintains a "transaction log" on every database. Should we ever have to restore a database from backup, your data will be current up to the last keystroke. In addition to these industry standard practices for maintaining data integrity, Compulogics goes even further with system "snapshots". This is an entire system backup, including databases, operating systems, etc.
